1. $F(n) = \Omega(g(n))$ implies $g(n) = O(f(n))$

Answer: True

By definition

$f(n) = \Omega(g(n))$ which implies $O \leq c.g(n) \leq f(n)$

$g(n) = O(f(n))$ which implies $O \leq g(n) \leq c.f(n)$

Let us assume that $f(n) = 100n^2$, $g(n) = n^2$

$f(n) \geq c.g(n)$

$100.n^2 \geq c.n^2$

Consider the constant $c = 50$

$100n^2 \geq 50n^2$

$2 \geq 1$

$g(n) = O(f(n))$ which is equal to

$c.f(n) \geq g(n)$

$c.100.n^2 \geq n^2$

$50.100.n^2 \geq n^2$

$5000 \geq 1$

Based on the above equations $F(n) = \Omega(g(n))$ implies $g(n) = O(f(n))$ is true.

2. $T(n) = 2T(n/2) + n^4$

$T(n) = 2T(n/2) + n^4$ – step 1

Let us assume that $n = n/2$

$T(n/2) = 2T(n/4) + (n/2)^4$

$T(n/2) = 2T(n/4) + n^4/16$ – step 2

Substitute 2 in 1

$T(n) = 2[2T(n/4) + n^4/2^4] + n^4$

$T(n) = 2^2T(n/2^2) + 1/2^3.n^4 + n^4$ – step 3

Substitute $n = n/2$ in step 2

$T(n/4) = 2T(n/8) + (n/2)^4.1/16$

$$= 2T(n/8) + n^4/2^8 - \text{step 4}$$

Substitute 4 in 3

$$\begin{aligned} T(n) &= 2^2[2T(n/8) + n^4/2^8] + (n^4/2^3) + n^4 \\ &= 2^3.T(n/2)^3 + n^4/2^6 + n^4/2^3 + n^4 \\ &= 2^3(T(n/2^3)) + n^4(1/8^2 + 1/8 + 1) \end{aligned}$$

After K substitutions

$$= 2^k T(n/2^k) + ((2^k)^4) \cdot \sum_{k=1}^{k-1} (1/8)$$

Let $n = 2^k$, $k = \log n$

$$\begin{aligned} T(n) &= nT(1) + n^4 \cdot (1/8)^k \\ &= n + n^4 \cdot 1^{\log n} / 8^{\log n} \\ &= n + n^4 \cdot (0.125)^{\log n} \end{aligned}$$

As n increases $(0.125)^{\log n}$ decreases and it can be ignored.

So, $T(n) = \theta(n^4)$
